

New stages of registration:

1. CREATE_PROFILE
2. PROFILE_IMAGE
3. REGISTERED

Delete any other stages

Functions to change or create:

1. **registerUser:**
 - a. Accept the latest terms and conditions automatically by calling *getLatestTerms* and *acceptTerms*.
 - b. Set registration status to CREATE_PROFILE
2. **createProfile:**
 - a. Function takes a new param: "username" which is required
 - b. Before saving data, call *checkUsernameExists* function to make sure the username does not exist. If the username does exist return error code 8 and do not save the details.
 - c. If the username does not exist then call webpurify to check for profanity. If there is profanity return error code 6.
 - d. Remove mailChimp code from this function
 - e. Set user preferences for distanceUnit to KM by calling *updatePreferences*
 - f. Set isPushEnabled to false
 - g. Set registration status to PROFILE_IMAGE
3. **updateProfile:**
 - a. Same logic as *createProfile* however do not set user preference for distanceUnit and do not set registration status.
4. **saveUsername**
 - a. Delete this function
5. **createMarketingProfile**
 - a. Create new function
 - b. This function takes a boolean marketingOptIn
 - c. Set the user isOptInMarketing field in the user document to the value of marketingOptIn
 - d. If marketingOptIn is true then create a mailchimp profile with the users firstName, lastName, email and username. Once the MailChimp user is created, update the users firebase document with their MailChimp ID.

NOTES FOR APP DEVS:

- We need to make sure we are getting the latest terms from the server on each app start-up so that we can check if we need to show the new terms screen?
